

Academic research groups: evaluation of their quality, quality of their evaluation

Using empirical data from the British system of evaluation of academic research (RAE, REF), we developed a very simple model which accounts relatively well for the quality of academic research groups as a function of their size.

Since the process of evaluation of research quality is time-consuming, and consequently expensive, policy makers have proposed some alternative to peer-reviewing, using bibliometrics indicators. Recently, we compared predictions from a ``scientometrics based evaluation'' with the ``peer reviewing system''.

The talk will summarize the work done in this context.
